

High Capacity Injection System

Designed for those drip tape users that want to layout or inject tape on a large scale. Large drip tape installations require installation equipment that is cost effective and efficient, allowing the user to cover a large area quickly and accurately. This system has many unique features designed specifically for the large scale operation:

- Reel carriers are designed to accept the largest reusable tape reel on the market, the 24-inch Agri-Spool II. Each carrier can hold up to three reels of new or used tape, feeding tape to 1 - 3 injection or layout tools per bed.
- The 24-inch Agri-Spool II can hold up to 7500 feet of heavy wall drip tape.
- No heavy lifting required to install full reels of tape into carrier.
- Floating tool mounts let injection tools adjust to the requirements of each individual row, maintaining uniform layout depths even on the widest toolbars.
- Toolbar designed to accept all Andros injection and layout tools.
- Optional bedshapers create a finished bed for planting over tape.
