

Coil Carriers

Andros Coil Carriers provide drip hose users a **dependable** and **safe** method of installing drip hose in above and below ground applications. **Dependable**, because the rugged, yet simple design guarantees uniform performance under a wide variety of operating conditions, and **safe**, because the unique design allows use of any manufacturers drip hose with a minimal amount of adjustment.

The heavy-duty side flanges easily adjust to any manufacturers hose. All exposed metal components are zinc plated to resist corrosion. Precision bearings in the carrier assembly insure long life, and a tensioning system on the carrier shaft provides gentle tension to prevent overrun at the end of the row. The carrier mounts to any toolbar using standard clamps. In addition to laying out hose, these carriers are also available with a retrieval option that allows users to retrieve hose for reuse or disposal. Available with either open or closed center hydraulics, the coil retrieval option can run in single or multiple head configurations using the tractors auxiliary hydraulics. A speed control allows the operator to control tension and speed of retrieval.

Available Options

Articulating Tool Bar Mount

Reel lowers to loading position, the spring loaded tool bar mount then raises and locks in working position.

Rotating Tool Bar Mount

Reel rotates and locks in multiple positions to allow hose to be dispensed or retrieved at any angle. Excellent for orchard applications where hose is injected under the trees' low hanging branches.

Retrieval Option

Uses tractor's auxiliary hydraulics. Kit includes speed control valve, hoses, quick and connect fittings for attachment to tractor.

These carriers, whether for layout or retrieval, are the industry standard with hundreds in use across the country. Contact your local Andros dealer to find out how you can use these, and the entire Andros line of drip irrigation tools to maximize the efficiency of your drip irrigation system.
