

# Shallow Injection Tool

The Shallow Injection Tool from Andros Engineering enables any grower to inject drip tape in a cost effective and efficient manner. The unique features incorporated into this tool's design insure that injecting tape will be done accurately and safely. Quality construction and the use of wear resistant materials guarantee the integrity of the injected tape while maintaining a long working life for the tool.

Used in combination with a Universal Reel Carrier, this tool provides a very versatile and adaptable system for shallow injection or surface layout of 5/8" and 7/8" drip tape. It is ideal for use on tool bars pulling planters and bedshapers that may have a limited amount of space available for mounting additional tools. The leading edge of the tool is designed to minimize soil disturbance allowing the placement of tape close to growing young plants, or on freshly planted beds.

A specially designed plastic guide located in the foot of the tool ensures that tape will lay flat in the bed eliminating problems associated with twisted or kinked tape. Large clearances inside the tool body allow for passage of mechanical couplers. An ever-growing network of Andros Engineering dealers insure that parts and service are available to the customer.
